Hard-Margin SVM and Large Margin

1. Answer: [d]

$$\text{令 } \mathbf{w} = \begin{pmatrix} w_1 \\ w_2 \\ w_3 \end{pmatrix}, \mathbf{w}^* \text{ 為一解, 則必滿足 } \begin{cases} w_1 - 2w_2 + 4w_3 + b \leq -1 & (1) \\ w_1 + b \geq 1 & (2) \\ w_1 + 2w_2 + 4w_3 + b \leq -1 & (3) \end{cases}$$

$$\text{由 (1)(2) 和 (1)(3) 可得 } \begin{cases} +2w_2 - 4w_3 \geq 1 & (4) \\ -2w_2 - 4w_3 \geq 1 & (5) \end{cases}, \text{ 由 (4)(5) 可推至 } w_3 \leq -\frac{1}{2} \text{ 和 } w_2 = 0,$$

代回 (1) 可得 $w_1 + b \leq 1$, 綜上所敘, 需同時滿足 $w_1 + b \leq 1$ 以及 $w_1 + b \geq 1$, 則 $w_1 + b = 1$ 。

$$\frac{1}{2} \mathbf{w}^T \mathbf{w} = \frac{1}{2}(w_1^2 + w_2^2 + w_3^2) \geq \frac{1}{2}(w_2^2 + w_3^2) \text{ 恆成立, 得最佳解 } \mathbf{w}^* \text{ 的 } w_1^* = 0 \text{ 且 } b^* = 1。$$

2. Answer: [b]

由上題已知, $w_2^* = 0, w_1^* = 0, b^* = 1$, 則 $\frac{1}{2} \mathbf{w}^T \mathbf{w} = \frac{1}{2} w_3^2$ 。

$$\text{因為 } w_3 \leq -\frac{1}{2}, \text{ 得 } \frac{1}{2} \mathbf{w}^T \mathbf{w} \leq \frac{1}{8}, (\mathbf{w}^*)^T \mathbf{w}^* = \frac{1}{4}, \text{margin}(\mathbf{b}^*, \mathbf{w}^*) = \frac{1}{\|\mathbf{w}^*\|} = \frac{1}{2} = 2。$$

3. Answer: [e]

令 $h(x) = \text{sign}(x - \theta)$, 若 h 為一 feasible solution 表示 h 能使 $E_{in}(h) = 0$, 如果 θ 不在 x_M 和 x_{M+1} 之間, 必存在至少一 $y_n = -1$ 且 $x_n > \theta$ 或 $y_n = +1$ 且 $x_n < \theta$ 的情況使得 $E_{in}(h) \neq 0$, 因此 θ 必介於 x_M 和 x_{M+1} , 得 $\text{margin}(\theta) = \min_i |x_i - \theta| = \min(|x_M - \theta|, |x_{M+1} - \theta|)$ 。

令一常數 $\epsilon \in [-\frac{1}{2}(x_{M+1} - x_M), \frac{1}{2}(x_{M+1} - x_M)]$, 使得 $\theta = \frac{1}{2}(x_{M+1} + x_M) + \epsilon$ 。

當 $\epsilon \geq 0$, 則 $\text{margin}(\theta) = \frac{1}{2}(x_{M+1} - x_M) - \epsilon$; 當 $\epsilon < 0$, 則 $\text{margin}(\theta) = \frac{1}{2}(x_{M+1} - x_M) + \epsilon$ 。

綜上所述, $\text{margin}(\theta) = \frac{1}{2}(x_{M+1} - x_M) - |\theta| \leq \frac{1}{2}(x_{M+1} - x_M)$, 當 $\epsilon = 0$ 時, $\theta = \frac{1}{2}(x_M + x_{M+1})$ 為最佳解, 得最大值 $\text{margin}(\theta) = \frac{1}{2}(x_{M+1} - x_M)$ 。

4. Answer: [a]

dichotomy 所有可能為 $\mathcal{H} = \{\odot\odot, \times\times, \odot\times, \times\odot\}$, 分別對應的數量為 1, 根據題意, 令指定的 dichotomy 為 h , 「expected number of dichotomies」可寫作 $\sum_{h \in \mathcal{H}} 1 \cdot P(h)$, $P(h)$ 可分成 $\{\odot\odot, \times\times\}$ 和 $\{\odot\times, \times\odot\}$ 兩種情況討論:

當 $h \in \{\odot\odot, \times\times\}$ 時, 因為 threshold 沒有區間限制, threshold 只要設大於 $1 + \rho$ /小於 $0 - \rho$ 必然會發生 $\times\times/\odot\odot$ 被 shatter 的情況, 得 $P(h) = P[\odot\odot] = P[\times\times] = 1$ 。

當 $h \in \{\odot\times, \times\odot\}$ 時, 只要在 $|x_1 - x_2| \geq 2\rho$ 的情況, 必可找到 threshold 將 x_1 和 x_2 劃分為不同類, 得 $P(h) = P[\odot\times] = P[\times\odot] = P[|x_1 - x_2| \geq 2\rho]$, 令 x_1 和 x_2 的機率密度為 $f_{X_1, X_2}(x_1, x_2)$, 密度積分面積如下圖所示(以 $\rho = 0.2$ 為例):

$$\begin{aligned}
 P[|x_1 - x_2| \geq 2\rho] &= \int \int_{|x_1 - x_2| \geq 2\rho} f_{X_1, X_2}(x_1, x_2) dx_1 dx_2, \quad x_1 \text{ 和 } x_2 \text{ 互相獨立且為介於 } [0, 1] \text{ 的平均分布,} \\
 &= \int \int_{|x_1 - x_2| \geq 2\rho} \left(\frac{1}{1-0} \cdot \frac{1}{1-0}\right) dx_1 dx_2 = \frac{1}{2}(1-2\rho)^2 + \frac{1}{2}(1-2\rho)^2 = (1-2\rho)^2
 \end{aligned}$$

綜上所述, $\sum_{h \in \mathcal{H}} 1 \cdot P(h) = P[\odot \odot] + P[\times \times] + P[\odot \times] + P[\times \odot] = 2 + 2(1-2\rho)^2$

Dual Problem of Quadratic Programming

5. Answer: [c]

根據題意, uneven-margin SVM 目標 $\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\alpha})$ 可以寫作:

$$\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}} \left\{ \frac{1}{2} \mathbf{w}^T \mathbf{w} + \sum_{n=1}^N \alpha_n (\llbracket y_n = +1 \rrbracket (\rho_+ - y_n(\mathbf{w}^T \mathbf{x}_n + b)) + \llbracket y_n = -1 \rrbracket (\rho_- - y_n(\mathbf{w}^T \mathbf{x}_n + b))) \right\}$$

當 $\frac{\partial \mathcal{L}(b, \mathbf{w}, \boldsymbol{\alpha})}{\partial b} = 0$ 時:

$$\sum_{n=1}^N \alpha_n (\llbracket y_n = +1 \rrbracket y_n + \llbracket y_n = -1 \rrbracket y_n) = \sum_{n=1}^N \alpha_n y_n = 0$$

當 $\frac{\partial \mathcal{L}(b, \mathbf{w}, \boldsymbol{\alpha})}{\partial \mathbf{w}} = 0$ 時:

$$\mathbf{w} + \sum_{n=1}^N \alpha_n (\llbracket y_n = +1 \rrbracket (-y_n \mathbf{x}_n) + \llbracket y_n = -1 \rrbracket (-y_n \mathbf{x}_n)) = \mathbf{w} - \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n = 0, \quad \mathbf{w} = \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n$$

將 $\sum_{n=1}^N \alpha_n y_n = 0$ 和 $\mathbf{w} = \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n$ 兩限制代入 $\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\alpha})$:

$$\begin{aligned}
\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\alpha}) &= \max_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \mathbf{x}_n^T \mathbf{x}_m \right. \\
&\quad + \sum_{n=1}^N \alpha_n (\llbracket y_n = +1 \rrbracket (\rho_+ - \sum_{m=1}^N \alpha_m y_n y_m \mathbf{x}_n^T \mathbf{x}_m) \\
&\quad \left. + \llbracket y_n = -1 \rrbracket (\rho_- - \sum_{m=1}^N \alpha_m y_n y_m \mathbf{x}_n^T \mathbf{x}_m)) \right\} \\
&= \max_{\text{all } \alpha_n \geq 0} \left\{ -\frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \mathbf{x}_n^T \mathbf{x}_m \right. \\
&\quad \left. + \sum_{n=1}^N \alpha_n \llbracket y_n = +1 \rrbracket \rho_+ + \sum_{n=1}^N \alpha_n \llbracket y_n = -1 \rrbracket \rho_- \right\} \\
&= \min_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \mathbf{x}_n^T \mathbf{x}_m \right. \\
&\quad \left. - \sum_{n=1}^N \alpha_n \llbracket y_n = +1 \rrbracket \rho_+ - \sum_{n=1}^N \alpha_n \llbracket y_n = -1 \rrbracket \rho_- \right\}
\end{aligned}$$

6. Answer: [e]

令 $\boldsymbol{\alpha}, \mathbf{w}, b$ 為 $\rho_+ = \rho_- = 1$ 時的 feasible solution, $\boldsymbol{\alpha}' = \frac{\rho_+ + \rho_-}{2} \boldsymbol{\alpha}$,

則 $\mathbf{w}' = \sum_{n=1}^N \alpha_n' y_n \mathbf{x}_n = \frac{\rho_+ + \rho_-}{2} \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n = \frac{\rho_+ + \rho_-}{2} \mathbf{w}$ 。

因為 $\frac{\rho_+ + \rho_-}{2} \geq 0$ 和 $\alpha_n \geq 0$, 因此 $\alpha_n' \geq 0$ 亦成立, 符合 dual feasible 的條件。

因為 $\sum_{n=1}^N \alpha_n y_n = 0$, $\sum_{n=1}^N \alpha_n' y_n = \frac{\rho_+ + \rho_-}{2} \sum_{n=1}^N \alpha_n y_n = \frac{\rho_+ + \rho_-}{2} \cdot 0 = 0$, 符合 dual-inner optimal 的條件。

為符合 primal feasible 以及 complementary slackness, 令 $b' = \frac{\rho_+ + \rho_-}{2} b + \frac{\rho_+ - \rho_-}{2}$, 共可依據 $y_n = +1/-1$ 和 $y_n(\mathbf{w}'^T \mathbf{x}_n + b') > 1/y_n(\mathbf{w}'^T \mathbf{x}_n + b) = 1$ 分成四個狀況討論:

當 $y_n = +1$ 且 $y_n(\mathbf{w}'^T \mathbf{x}_n + b) = 1$ 時:

$$y_n(\mathbf{w}'^T \mathbf{x}_n + b') = \frac{\rho_+ + \rho_-}{2} y_n(\mathbf{w}'^T \mathbf{x}_n + b) + \frac{\rho_+ - \rho_-}{2} y_n = \frac{\rho_+ + \rho_-}{2} \cdot 1 + \frac{\rho_+ - \rho_-}{2} \cdot 1 = \rho_+$$

當 $y_n = +1$ 且 $y_n(\mathbf{w}'^T \mathbf{x}_n + b) > 1$ 時:

$$y_n(\mathbf{w}'^T \mathbf{x}_n + b') = \frac{\rho_+ + \rho_-}{2} y_n(\mathbf{w}'^T \mathbf{x}_n + b) + \frac{\rho_+ - \rho_-}{2} y_n > \frac{\rho_+ + \rho_-}{2} \cdot 1 + \frac{\rho_+ - \rho_-}{2} \cdot 1 = \rho_+$$

當 $y_n = -1$ 且 $y_n(\mathbf{w}'^T \mathbf{x}_n + b) = 1$ 時:

$$y_n(\mathbf{w}'^T \mathbf{x}_n + b') = \frac{\rho_+ + \rho_-}{2} y_n(\mathbf{w}'^T \mathbf{x}_n + b) + \frac{\rho_+ - \rho_-}{2} y_n = \frac{\rho_+ + \rho_-}{2} \cdot 1 + \frac{\rho_+ - \rho_-}{2} \cdot -1 = \rho_-$$

當 $y_n = -1$ 且 $y_n(\mathbf{w}'^T \mathbf{x}_n + b) > 1$ 時:

$$y_n(\mathbf{w}'^T \mathbf{x}_n + b') = \frac{\rho_+ + \rho_-}{2} y_n(\mathbf{w}'^T \mathbf{x}_n + b) + \frac{\rho_+ - \rho_-}{2} y_n > \frac{\rho_+ + \rho_-}{2} \cdot 1 + \frac{\rho_+ - \rho_-}{2} \cdot -1 = \rho_-$$

綜上所述, 當 $\boldsymbol{\alpha}' = \frac{\rho_+ + \rho_-}{2} \boldsymbol{\alpha}$, $\mathbf{w}' = \frac{\rho_+ + \rho_-}{2} \mathbf{w}$ 且令 $b' = \frac{\rho_+ + \rho_-}{2} b + \frac{\rho_+ - \rho_-}{2}$ 時, 符合 uneven-margin SVM 的 KKT 條件, 必為 feasible solution。

令 α^* 為 α 的 optimal solution, 則:

$$\begin{aligned}
\frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha'_n \alpha'_m y_n y_m &= \left(\frac{\rho_+ + \rho_-}{2} \right)^2 \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \geq \left(\frac{\rho_+ + \rho_-}{2} \right)^2 \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n^* \alpha_m^* y_n y_m \\
&= \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \left(\frac{\rho_+ + \rho_-}{2} \alpha_n^* \right) \left(\frac{\rho_+ + \rho_-}{2} \alpha_m^* \right) y_n y_m
\end{aligned}$$

$\frac{\rho_+ + \rho_-}{2} \alpha^*$ 恆為可以更接近目標的 feasible solution, 得 α' 的 optimal solution 為 $\frac{\rho_+ + \rho_-}{2} \alpha^*$ 。

7. Answer: [d]

令 $K(\mathbf{x}, \mathbf{x}')$ 對應到的 Gram matrix 為 $\begin{pmatrix} \frac{1}{2}, \frac{1}{2} \\ \frac{1}{2}, \frac{1}{2} \end{pmatrix}$, $\det \begin{pmatrix} \frac{1}{2} - \lambda, \frac{1}{2} \\ \frac{1}{2}, \frac{1}{2} - \lambda \end{pmatrix} = 0$, $\lambda(\lambda - 1) = 0$, eigenvalue 為 0, 1。

則 $\log_2 K(\mathbf{x}, \mathbf{x}')$ 對應到的 Gram matrix 為 $\begin{pmatrix} -1, -1 \\ -1, -1 \end{pmatrix}$, $\det \begin{pmatrix} -1 - \lambda, -1 \\ -1, -1 - \lambda \end{pmatrix} = 0$, $\lambda(\lambda + 2) = 0$, eigenvalue 為 0, -2。

因為 $\log_2 K(\mathbf{x}, \mathbf{x}')$ 的 Gram matrix 的 eigenvalue 存在小於 0 的可能, 不符合 positive semi-definite 的性質, 因此 $\log_2 K(\mathbf{x}, \mathbf{x}')$ 不具備 valid kernel 的條件。

8. Answer: [c]

$$\|\phi(\mathbf{x}) - \phi(\mathbf{x}')\|^2 = \phi(\mathbf{x})^T \phi(\mathbf{x}) - \phi(\mathbf{x})^T \phi(\mathbf{x}') - \phi(\mathbf{x}')^T \phi(\mathbf{x}) + \phi(\mathbf{x}')^T \phi(\mathbf{x}')$$

當 $\mathbf{x} - \mathbf{x}' = 0$, $\exp(\gamma \|\mathbf{x} - \mathbf{x}'\|^2) = 1$, 為極大值; 當 $\mathbf{x} - \mathbf{x}' \rightarrow \infty$, $\exp(\gamma \|\mathbf{x} - \mathbf{x}'\|^2) \rightarrow 0$, 為極小值, 根據題意代入 $\phi(\mathbf{x}_1)^T \phi(\mathbf{x}_2) = \exp(\gamma \|\mathbf{x}_1 - \mathbf{x}_2\|^2)$, 可得 $\|\phi(\mathbf{x}) - \phi(\mathbf{x}')\|^2 = 2 - 2 \exp(\gamma \|\mathbf{x} - \mathbf{x}'\|^2) \leq 2$ 。由上述可知, $\|\phi(\mathbf{x}) - \phi(\mathbf{x}')\|^2$ 有可能發生超過 1 的情況, 因此 2 為「the tightest upper bound」。

9. Answer: [d]

根據題意, 令 $h_{\alpha, b}(\mathbf{x}_n) = \text{sign}(\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n))$, 若 $E_{in}(h) = 0$, 表示所有 $h_{\alpha, b}(\mathbf{x}_n) = y_n$ 皆成立。

(1) 當 $y_n = +1$ 時:

$$\begin{aligned}
\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) &= \sum_{\substack{m=1 \\ m \neq n}}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) + 1 \geq \sum_{\substack{m=1 \\ m \neq n}}^N (-1) \cdot K(\mathbf{x}_m, \mathbf{x}_n) + 1 \\
&\geq \sum_{\substack{m=1 \\ m \neq n}}^N (-1) \cdot \exp(-\gamma \epsilon^2) + 1 = -(N-1) \exp(-\gamma \epsilon^2) + 1
\end{aligned}$$

$\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) > 0$ 皆成立代表 $y_n = +1$ 的情況都會答對, 若 $-(N-1) \exp(-\gamma \epsilon^2) + 1 > 0$ 成立,

則 $\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) > 0$ 必成立, 整理移項後, 得 $(N-1) \exp(-\gamma \epsilon^2) < 1$ 。

(2) 當 $y_n = -1$ 時:

$$\begin{aligned}\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) &= \sum_{\substack{m=1 \\ m \neq n}}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) - 1 \leq \sum_{\substack{m=1 \\ m \neq n}}^N (+1) \cdot K(\mathbf{x}_m, \mathbf{x}_n) - 1 \\ &\leq \sum_{\substack{m=1 \\ m \neq n}}^N (+1) \cdot \exp(-\gamma \epsilon^2) - 1 = (N-1) \exp(-\gamma \epsilon^2) - 1\end{aligned}$$

$\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) \leq 0$ 皆成立代表 $y_n = -1$ 的情況都會答對, 若 $(N-1) \exp(-\gamma \epsilon^2) - 1 \leq 0$ 成立,

則 $\sum_{m=1}^N y_m K(\mathbf{x}_m, \mathbf{x}_n) \leq 0$ 必成立, 整理移項後, 得 $(N-1) \exp(-\gamma \epsilon^2) \leq 1$ 。

由 (1)(2) 得, $(N-1) \exp(-\gamma \epsilon^2) \leq 1$ 成立時, $E_{in}(h) = 0$ 必成立, 將其取對數並移項整理, 得 $\gamma \geq \frac{\ln(N-1)}{\epsilon^2}$, 且 $\frac{\ln(N-1)}{\epsilon^2}$ 為最小選項, 因此 $\frac{\ln(N-1)}{\epsilon^2}$ 為「the tightest lower bound」。

Kernel Perceptron Learning Algorithm

10. Answer: [c]

由題意可知 $\mathbf{w}_{t+1} = \mathbf{w}_t + \llbracket y_{n(t)} \neq \text{sign}(\mathbf{w}_t^T \phi(\mathbf{x}_{n(t)})) \rrbracket \cdot y_{n(t)} \phi(\mathbf{x}_{n(t)})$, 代入 $\mathbf{w}_t = \sum_{n=1}^N \alpha_{t,n(t)} \phi(\mathbf{x}_{n(t)})$,

得 $\mathbf{w}_{t+1} = \sum_{n=1}^N (\alpha_{t,n(t)} + \llbracket y_{n(t)} \neq \text{sign}(\mathbf{w}_t^T \phi(\mathbf{x}_{n(t)})) \rrbracket \cdot y_{n(t)}) \phi(\mathbf{x}_{n(t)}) = \sum_{n=1}^N \alpha_{t+1,n(t)} \phi(\mathbf{x}_{n(t)})$,

綜上所述, 參數更新式可寫作 $\alpha_{t+1} \leftarrow \alpha_t$ except $\alpha_{t+1,n(t)} \leftarrow \alpha_{t,n(t)} + y_{n(t)}$ 。

11. Answer: [a]

根據題意代入 $\mathbf{w}_t = \sum_{n=1}^N \alpha_{t,n} \phi(\mathbf{x}_n)$, $\mathbf{w}_t^T \phi(\mathbf{x}) = \sum_{n=1}^N \alpha_{t,n} \phi(\mathbf{x}_n)^T \phi(\mathbf{x}) = \sum_{n=1}^N \alpha_{t,n} K(\mathbf{x}_n, \mathbf{x})$

12. Answer: [b]

根據題意, 因為所有 \mathbf{x}_n 皆為 bounded SV, 對所有 \mathbf{x}_n 需滿足兩條件: $\begin{cases} y_n - y_n \xi_n = \mathbf{w}^T \mathbf{x}_n + b \\ \xi_n \geq 0 \end{cases}$

(1) 當 $y_n = +1$ 時:

$y_n - y_n \xi_n = 1 - \xi_n = \mathbf{w}^T \mathbf{x}_n + b$, 整理移項, 得 $\xi_n = 1 - (\mathbf{w}^T \mathbf{x}_n + b)$, 因為所有 $y_n = +1$ 的 \mathbf{x}_n 滿足 $\xi_n \geq 0$ 的條件等價於 $\min_{n:y_n > 0} \xi_n \geq 0$, 將其代入 $\xi_n = 1 - (\mathbf{w}^T \mathbf{x}_n + b)$, 則 $\min_{n:y_n > 0} \{1 - (\mathbf{w}^T \mathbf{x}_n + b)\} \geq 0$,

可得 $b \leq \min_{n:y_n > 0} \{1 - \mathbf{w}^T \mathbf{x}_n\} = \min_{n:y_n > 0} \{1 - \sum_{m=1}^N y_m \alpha_m K(\mathbf{x}_m, \mathbf{x}_n)\}$

(2) 當 $y_n = -1$ 時:

$y_n - y_n \xi_n = \xi_n - 1 = \mathbf{w}^T \mathbf{x}_n + b$, 整理移項, 得 $\xi_n = 1 + \mathbf{w}^T \mathbf{x}_n + b$, 因為所有 $y_n = -1$ 的 \mathbf{x}_n 滿足 $\xi_n \geq 0$ 的條件等價於 $\min_{n:y_n < 0} \xi_n \geq 0$, 將其代入 $\xi_n = 1 + \mathbf{w}^T \mathbf{x}_n + b$, 則 $\min_{n:y_n < 0} \{1 + \mathbf{w}^T \mathbf{x}_n + b\} \geq 0$,

可得 $b \geq -\min_{n:y_n < 0} \{1 + \mathbf{w}^T \mathbf{x}_n\} = -\min_{n:y_n < 0} \{1 + \sum_{m=1}^N y_m \alpha_m K(\mathbf{x}_m, \mathbf{x}_n)\}$

由 (1)(2) 可推得 b 的合法範圍, $-\min_{n:y_n < 0} \{1 + \sum_{m=1}^N y_m \alpha_m K(\mathbf{x}_m, \mathbf{x}_n)\} \leq b \leq \min_{n:y_n > 0} \{1 - \sum_{m=1}^N y_m \alpha_m K(\mathbf{x}_m, \mathbf{x}_n)\}$,
 b 最大值為 $\min_{n:y_n > 0} \{1 - \sum_{m=1}^N y_m \alpha_m K(\mathbf{x}_m, \mathbf{x}_n)\}$ 。

13. Answer: [e]

根據題意, SVM 目標 $\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}, \boldsymbol{\xi}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})$ 可以寫作:

$$\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}, \boldsymbol{\xi}} \left\{ \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n^2 + \sum_{n=1}^N \alpha_n (1 - \xi_n - y_n (\mathbf{w}^T \mathbf{x}_n + b)) \right\}$$

當 $\frac{\partial \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})}{\partial b} = 0$ 時, $\sum_{n=1}^N \alpha_n y_n = 0$; 當 $\frac{\partial \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})}{\partial \mathbf{w}} = 0$ 時, $\mathbf{w} - \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n = 0$, $\mathbf{w} = \sum_{n=1}^N \alpha_n y_n \mathbf{x}_n$

當 $\frac{\partial \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})}{\partial \xi_n} = 0$ 時, $2C \cdot \xi_n - \alpha_n = 0$, $\xi_n = \frac{\alpha_n}{2C}$ 。

將上述三個條件代入 $\max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}, \boldsymbol{\xi}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})$ 可得:

$$\begin{aligned} \max_{\text{all } \alpha_n \geq 0} \min_{b, \mathbf{w}, \boldsymbol{\xi}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha}) &= \max_{\text{all } \alpha_n \geq 0} \left\{ -\left(\frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m K(\mathbf{x}_n, \mathbf{x}_m) + C \cdot \sum_{n=1}^N \frac{\alpha_n^2}{4C^2} - \sum_{n=1}^N \alpha_n \right) \right\} \\ &= \min_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m K(\mathbf{x}_n, \mathbf{x}_m) + C \cdot \sum_{n=1}^N \frac{\alpha_n^2}{4C^2} - \sum_{n=1}^N \alpha_n \right\} \\ &= \min_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m K(\mathbf{x}_n, \mathbf{x}_m) + \frac{1}{2} \sum_{n=1}^N \frac{\alpha_n^2}{2C} - \sum_{n=1}^N \alpha_n \right\} \\ &= \min_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m K(\mathbf{x}_n, \mathbf{x}_m) \right. \\ &\quad \left. + \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \frac{1}{2C} \llbracket n = m \rrbracket - \sum_{n=1}^N \alpha_n \right\} \\ &= \min_{\text{all } \alpha_n \geq 0} \left\{ \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m (K(\mathbf{x}_n, \mathbf{x}_m) + \frac{1}{2C} \llbracket n = m \rrbracket) - \sum_{n=1}^N \alpha_n \right\} \end{aligned}$$

14. Answer: [c]

由上題可知, 為滿足 $\min_{b, \mathbf{w}, \boldsymbol{\xi}} \mathcal{L}(b, \mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha})$ 的條件, solution 必滿足 $\xi_n = \frac{\alpha_n}{2C}$, 因此 $\boldsymbol{\xi}^* = \frac{1}{2C} \boldsymbol{\alpha}^*$ 恆成立。

Experiment

程式碼實作細節如下, 可以透過 parser 的 `--tra_path/--tst_path` 設置訓練資料和測試資料的路徑

python code.py --tra_path satimage.scale --tst_path satimage.scale.t

```
from svmutil import *
import numpy as np
import argparse

'''Define Function'''
```

```

def label_filtering(Y, label):
    Y_tmp = np.zeros(Y.shape)
    Y_tmp[Y == label] = 1
    Y_tmp[Y != label] = -1
    return Y_tmp

def feature_processing(X):
    X_tmp = []
    for x in X:
        x_tmp = np.zeros(36)
        for i in x:
            x_tmp[i - 1] = x[i]
        X_tmp.append(x_tmp)
    return np.array(X_tmp)

def get_data(path):
    Y, X = svm_read_problem(path)
    return np.array(Y), feature_processing(X)

def main():
    '''Parsing'''
    parser = argparse.ArgumentParser(
        description='Argument Parser for ML HW5.')

    parser.add_argument('--tra_path', default='satimage.scale')
    parser.add_argument('--tst_path', default='satimage.scale.t')
    args = parser.parse_args()

    # load data
    Y_tra_mul, X_tra = get_data(args.tra_path)
    Y_tst_mul, X_tst = get_data(args.tst_path)
